

After doing some research about SQL here is what I learned:

1. It's important to understand the structure of the data you're working with before starting and how data in terms of tables are organized.
2. Understood how to use joins in tables.
3. Understood how to use SQL with server side scripting like php
4. Understood the syntax that I need to use like how the select statement selects data from a database
5. I also learned about SQL functions like the string function, Math function etc.
